

Digital Video Gait Analysis

This resource enables the SOS Centres Podiatrists, Physiotherapists and Consultants to study the gait pattern of an individual to ascertain whether symptoms are being caused by biomechanical anomalies. Templo software is downloaded onto a computer, which permits the digital video camera to capture images. The software allows the clinician to study gait movements either: frame-by-frame, superimposed over each other or compared with previous studies.

Digital Video Gait Analysis is available at SOS Centres Weybridge, Sevenoaks and Brentwood. If you would like more information about this service then please call your local SOS Centres.
