

Proprioceptive (Balance) Analysis

The Kin Com Balance System evaluates an individual's proprioception (balance) whilst they stand on a sophisticated force plate that measures the smallest variations of movement.

By assessing a patient's balance, a good deal of information can be gained about their postural, core and proprioception status. An on-screen graphic display provides real time feedback and makes it easy for patients to reproduce specified motion patterns. If deficits are detected a programme designed to improve proprioception can be given to accelerate the patient's return to activity.

This facility is available at SOS Centres Weybridge. If you would like any further information about this service please contact SOS Centres Weybridge.
